

Kenta / Get started

Navigate organizations, projects and working scope

Choose the correct organization and project, keep record-list context, and open guidance without changing access.

Current · Revision 2 · Reviewed Oct 25, 2026

► Applicability

Before you begin

- An existing Aurona account with completed required authentication.
 - Access to the organization and the project or explicitly shared records you intend to inspect.
-

Organization and project are separate working contexts

The header identifies the active organization and, inside a project, the selected project. Portfolio views show the projects allowed by your current access. Selecting another organization changes context; it does not copy records or grant new authority.

A portfolio or program groups delivery work. Membership in a working scope does not replace project membership, technical-review authority or separately granted billing access. Shared collaborators may see only explicitly selected records.

Keep your place in guidance

Help is available from the application header. Opening Help uses a topic associated with the current route. Navigating the application does not replace an article you are reading; use Help for current page when you want the topic for the new workspace.

Inputs and terminology

Inputs and terminology

Term	Meaning
Working scope	Portfolio, program or project context used to organize work; it is not an access grant.
Record context	The current search, filters, sort, page and selected record associated with a working register.

Procedure

1. Choose the organization

Use the organization selector in the header. Select an organization already available to your account.

Check the organization label before opening project or billing records.

2. Open the project

Open Projects or All projects, find the project by its business name or reference, and open it.

Confirm the project reference in the header or breadcrumb before using Power Planning, Schedule, Equipment or Reviews.

3. Inspect and return

Open a record from its register. Use the register return control to retain its working context.

Use a stable record link when directing an authorized colleague to the same object; the colleague still needs independent access.

Verify the result

The header and breadcrumb identify the intended organization and project. Registers contain only currently authorized records.

What happens next

Navigation does not change project data, memberships, engineering authority or commercial permissions.

Troubleshooting

The organization or project is missing

Confirm that the current session belongs to the intended account. Check whether project membership or a shared-record grant has expired or been revoked. Ask an organization or project administrator to review the relevant grant. A different browser language does not change access.

A shared link opens a denied-access state

Check the active organization and the requested record. Confirm that the colleague has access to the same project or shared record. Request the necessary scoped access; do not copy restricted source files into a different organization.
